Dear Imanol,

How are you? I liked the way you drew your pacific chorus frog. Your name is interesting. I liked the characteristics of the frog. I like your name because it looks interesting to me. I am a Kenyan Citizen by birth and also I have a certificate. You you are an American citizen by birth. Every body has a birth certificate.

The answers for the questions:

1. Yes it camouflages. How? by coloration.
2. Snake, fish, bluegill fish, insects, owls and skunk
3. spiders, flies insect and tadpoles.

Your Penfriend,  
Dennese Ochieng

To Imanol

Hi Imanol, I hope your well. I want to thank you for writing about the Pacific Chorus frog. I never knew that the pacific chorus frog is that intelligent. I also want to tell you something about the animal I like most and about savannah.

There are two types of savannah that is the savannah woodland and the savannah grassland. Savannah covers most part of Kenya. In savannah grassland there are more tall grass than trees. The savannah grass is called elephant grass because the elephants feeds on them. In savannah woodland there are more trees than grass. Savannah is found in the lowlands. We should take care of the savannah grassland and the savannah woodlands so that we can protect some of the wild animals like the elephants that live there. The animal I like most is the Great Egret. The great egret eats fish, frogs, and crabs. Mostly it eats small animals that are found in water. It finds these animals by wadding very slowly in shallow water, or waiting patiently on the shore, waiting. Suddenly its beak darts out to capture its prey. These birds are 3 feet tall with a wing span of 4 ½ feet. They weigh only 2 pounds. Some people thinks these birds are snowy egrets, but those egrets are smaller, with yellow feet and a black bill. The great egret has black feet and a yellow bill. To me, the great egret is the most beautiful bird in the world.

From your pen pal, Lorriane Murlml

P.S. The answers to the questions you asked answers:

1. The Pacific chorus frog camouflages by adaptation range, migratory, and reproduction
2. What are the predators the predators are blue gillfish, insects, fish, snakes, birds, mammals, frogs, hawks, owls, skunks, and raccoons.
3. What does my animal eat? The animal that eats the Pacific chorus frogs are spiders, flies, insects, and tadpoles.
